How to abstract atoms in solid?

Background: Atomic Orbitals

$$\begin{cases} n = 1, 2, \dots \\ l \in [0, n-1] \\ m \in [-l, l] \end{cases} \quad \psi_{nlm}(r, \theta, \phi) = R_{nl}(r) Y_{lm}(\theta, \phi) \quad \begin{array}{ll} \text{s:} & l = 0 \\ \text{p:} & l = 1 \\ \text{d:} & l = 2 \end{array}$$

Radial function Spherical harmonics

- Hydrogen eigenstates ($\rho = v_{xc} = 0$)

	n	ℓ	m	$R_{n\ell}$	$Y_{\ell m}$
1s	1	0	0	$2 \left(\frac{1}{a_0}\right)^{3/2} e^{-r/a_0}$	$\frac{1}{2\sqrt{\pi}}$
2s	2	0	0	$\left(\frac{1}{2a_0}\right)^{3/2} \left(2 - \frac{r}{a_0}\right) e^{-r/2a_0}$	$\frac{1}{2\sqrt{\pi}}$
2p	2	1	0	$\left(\frac{1}{2a_0}\right)^{3/2} \frac{1}{\sqrt{3}} \frac{r}{a_0} e^{-r/2a_0}$	$\frac{1}{2} \sqrt{\frac{3}{\pi}} \cos \theta$
	2	1	± 1	$\left(\frac{1}{2a_0}\right)^{3/2} \frac{1}{\sqrt{3}} \frac{r}{a_0} e^{-r/2a_0}$	$\pm \frac{1}{2} \sqrt{\frac{3}{2\pi}} \sin \theta e^{\pm i\phi}$
⋮					

Laguerre polynomial

Hydrogen Eigenstates

Outer shells (*i.e.*, larger n) spread outward

See notes on (1) [Laplacian in spherical coordinates](#) & (2) [Schrodinger equation for spherically symmetric potentials](#)

Herman-Skillman Solutions for Atoms

- Hartree approximation ($v_{xc} = 0$) for many-electron interaction

Outer shells (*i.e.*, larger n) still spread outward

For the inclusion of xc potential, see notes on (1) [Numerical integration of radial wave function](#) & (2) [Kohn-Sham potential](#)

Atomic Orbitals

- s orbital ($l = 0$)

- p orbital ($l = 1$): Cartesian representation

$$\psi_{n1m}(r, \theta, \phi) \rightarrow \left(\frac{3}{4\pi}\right)^{1/2} R_{n1}(r) \begin{cases} x/r \\ y/r \\ z/r \end{cases} \quad r = \sqrt{x^2 + y^2 + z^2}$$

sp³ Hybridization: Pauling's Note (1930)

Calculations such as these are simplified by the fact that for a complete orthogonal transformation the sum of the squares of the coefficients for a given initial eigenfⁿ is unity. ③

Four equivalent bonds from sp³.

$$\begin{aligned}\psi_{\text{max}} &= \frac{1}{2}(s + x + y + z) \\ \psi_{\text{min}} &= \frac{1}{2}(s + x - y - z) \\ \psi_{\text{max}} &= \frac{1}{2}(s - x + y - z) \\ \psi_{\text{min}} &= \frac{1}{2}(s - x - y + z)\end{aligned}$$

Max. value.

We can point one ψ along the z axis, say.

$$\begin{aligned}\psi_1 &= \frac{1}{2}s + \frac{\sqrt{3}}{2}z \\ \psi_2 &= \frac{1}{2}s - \frac{1}{2\sqrt{3}}z + \frac{\sqrt{2}}{\sqrt{3}}x \\ \psi_3 &= \frac{1}{2}s - \frac{1}{2\sqrt{3}}z - \frac{1}{\sqrt{6}}x + \frac{1}{\sqrt{6}}y \\ \psi_4 &= \frac{1}{2}s - \frac{1}{2\sqrt{3}}z - \frac{1}{\sqrt{6}}x - \frac{1}{\sqrt{6}}y\end{aligned}$$

The coeff. of s is $\frac{1}{2}$ to make the ψ 's equivalent. Then the coeffs. of z are fixed for norm. orth.

tetrahedral angles. But if R_s stretches out farther than R_p (which it actually does for same Zeff.), then things are different.

Let us assume $\text{Max } s = \text{Max } p = 1$. Then

$$\frac{d}{da}(a + \sqrt{1-a^2}) = 0, a = \frac{1}{\sqrt{2}}. \text{Maximum possible} = \sqrt{2} = 1.414$$

Two bonds, Max value

$$\sigma_+ = 1.414$$

$$\sigma_- = 1.414$$

Three equal bonds: 1.392

Four equal bonds: 1.366

In this case two strong bonds will be oppositely directed (linear molecule), three will lie in a plane, four towards tetrahedron corners.

It may be significant that we get 4 tetrahedrally-directed bonds, each with the maximum possible strength (assuming $R_s = R_p$). This means that if R_s happens to equal R_p , two bonds or three bonds will be strongest when at

Charge Density at GaAs/Si (111) Interface

- Highest occupied states in Si have the hybrid sp^3 character
- Occupied GaAs states are As p-like (lowest unoccupied states are s-like)

Projection of Kohn-Sham wave functions onto atomic orbitals

	Band	Ga 4s	Ga 4p	Ga 4d	As 4s	As 4p	As 4d	Total

Electronic Configuration

The following represents the electronic configuration and its associated term symbol for the **ground state neutral gaseous atom**. The configuration associated with silicon in its compounds is not necessarily the same.

- **Ground state electron configuration:** $[\text{Ne}].3s^2.3p^2$
- **Shell structure:** 2.8.4

Abstraction: Pseudopotential

- Silicon — $1s^2 2s^2 2p^6 3s^2 3p^2$

- Consider only (chemically active) valence electrons
- Pseudopotential V_{pseudo} & pseudowave function Ψ_{pseudo} are constructed such that the latter agrees with the all-electron wave function Ψ_{AE} beyond a cutoff radius r_c
- It is not necessary to orthogonalize Ψ_{pseudo} to inner orbitals; resulting in a much more slowly varying function than Ψ_{AE}

Norm-Conserving Pseudopotential

Construct pseudopotentials such that:

1. Pseudowave functions, $R_l^{\text{PP}}(r)$ ($l = 0, 1, 2, \dots$), contain no nodes
2. $R_l^{\text{PP}}(r)$ coincides with the all-electron wave function $R_l^{\text{AE}}(r)$ beyond a cutoff radius r_{cl}
3. The charge enclosed within r_{cl} for the AE- & pseudo-wave functions must be equal

$$\int_0^{r_{\text{cl}}} 4\pi r^2 dr |R_l^{\text{PP}}(r)|^2 = \int_0^{r_{\text{cl}}} 4\pi r^2 dr |R_l^{\text{AE}}(r)|^2$$

4. AE- & pseudo-eigenenergies must be identical

$$E_l^{\text{PP}} = E_l^{\text{AE}}$$

5. Conditions 2 & 4 imply: the logarithmic derivatives of the two wave functions must match at r_{cl}

$$\left. \frac{1}{R_l^{\text{PP}}(r, E_l)} \frac{dR_l^{\text{PP}}(r, E_l)}{dr} \right|_{r=r_{\text{cl}}} = \left. \frac{1}{R_l^{\text{AE}}(r, E_l)} \frac{dR_l^{\text{AE}}(r, E_l)}{dr} \right|_{r=r_{\text{cl}}}$$

Troullier & Martins, *Phys. Rev. B* **41**, 1993 ('91)

See notes on (1) [Norm-conserving pseudopotential](#) & (2) [Logarithmic derivative](#)

Local & Nonlocal Pseudopotentials

- Ionic pseudopotential operator

$$\hat{V}_{\text{ion}}^{\text{PP}}(r) = V_{\text{ion,local}}^{\text{PP}}(r) + \sum_{l,m} |lm\rangle \Delta V_l(r) \langle lm|$$

Common to all
angular momenta

Angular-momentum
dependent

- (Example) Polyethylene slab without & with external electric field

- Fully nonlocal pseudopotential ~ projection

$$\hat{V}_{\text{NL}} = \sum_{l,m} |\chi_{lm}\rangle \langle \chi_{lm}| \text{ separable}$$

Kleinman & Bylander, *Phys. Rev. Lett.* **48**, 1425 ('82)

See notes on (1) [Nonlocal pseudopotential](#) & (2) [Fully nonlocal pseudopotential](#)

Projector-Augmented Wave (PAW)

- Core-charge correction significantly increases the transferability

$$\tilde{v}_{\text{xc}}(\mathbf{r}) = v_{\text{xc}}([\rho_{\text{PS}}], \mathbf{r}) + [v_{\text{xc}}([\rho_{\text{PS}} + \rho_{\text{core}}], \mathbf{r}) - v_{\text{xc}}([\rho_{\text{PS}}], \mathbf{r})]$$

Louie, Froyen & Cohen, *Phys. Rev. B* **50**, 1738 ('82)

- An “all-electron” electronic structure calculation that separates smooth pseudowave functions & rapidly varying all electron wave functions by using projection function

detail (all electron)-out

smooth-in

$$|\Psi^{\text{AE}}\rangle = |\Psi^{\text{PP}}\rangle + \sum_i (|\phi_i^{\text{AE}}\rangle - |\phi_i^{\text{PP}}\rangle) \langle p_i | \Psi^{\text{PP}} \rangle$$
