# Objective

- Derive quantum molecular dynamics (QMD) equations, which follow classical-mechanical trajectories of atoms, while computing interatomic interactions quantum mechanically:
  1. **Ehrenfest molecular dynamics (EMD)**
    - Solve *time-dependent Schrödinger equation (dynamic)* for electrons
    - Attosecond ( $10^{-18}$  s) to femtosecond ( $10^{-15}$  s) electron dynamics

P. Ehrenfest, *Zeit. Phys.* **45**, 455 ('27)
  2. **Born-Oppenheimer molecular dynamics (BOMD)**
    - Obtain the *electronic ground state (static)* at every time instance
    - Electron & nucleus dynamics above femtosecond ( $10^{-15}$  s)

M. Born & R. Oppenheimer, *Annal. Phys.* **84**, 457 ('27)

Paul Ehrenfest  
(1880-1933)

Max Born  
(1882-1970)

Robert Oppenheimer  
(1904-1967)

# Electron-Nucleus Dynamics

- Consider a system of  $N$  electrons &  $N_{\text{atom}}$  nuclei, with their position operators,  $\{\mathbf{r}_i | i = 1, \dots, N\}$  &  $\{\mathbf{R}_I | I = 1, \dots, N_{\text{atom}}\}$

$$\begin{aligned}
 H &= \sum_{I=1}^{N_{\text{atom}}} \frac{\mathbf{P}_I^2}{2M_I} + h(\{\mathbf{r}_i\}, \{\mathbf{R}_I\}) \\
 &= \sum_{I=1}^{N_{\text{atom}}} \left[ \frac{\mathbf{P}_I^2}{2M_I} + V_{\text{ext}}(\mathbf{R}_I) \right] + \sum_{i=1}^N \left[ -\frac{\hbar^2}{2m} \frac{\partial^2}{\partial \mathbf{r}_i^2} + v_{\text{ext}}(\mathbf{r}_i) \right] \\
 &\quad + \underbrace{\frac{1}{2} \sum_{i \neq j} \frac{e^2}{|\mathbf{r}_i - \mathbf{r}_j|}}_{\text{electron-electron interaction}} - \underbrace{\sum_{i,j} \frac{Z_j e^2}{|\mathbf{r}_i - \mathbf{R}_j|}}_{\text{electron-nuclei interaction}} + \underbrace{\frac{1}{2} \sum_{I \neq J} \frac{Z_I Z_J e^2}{|\mathbf{R}_I - \mathbf{R}_J|}}_{\text{nuclei-nuclei interaction}}
 \end{aligned}$$

- Here,  $\hbar$  is the Planck constant,  $\mathbf{P}_I$ ,  $M_I$  &  $Z_I$  are the momentum, mass & charge of the  $I$ -th nucleus, and  $m$  &  $e$  are the electron mass & charge;  $V_{\text{ext}}$  &  $v_{\text{ext}}$  are external potentials (like external electric field) acting on nuclei & electrons, respectively
- We focus on the system dynamics described by the time-dependent Schrödinger equation in non-relativistic quantum mechanics, where  $\Psi_{\text{e+n}}$  is the electron-nucleus wave function &  $t$  is the time

$$i\hbar \frac{\partial}{\partial t} \Psi_{\text{e+n}}(\{\mathbf{r}_i\}, \{\mathbf{R}_I\}, t) = H \Psi_{\text{e+n}}(\{\mathbf{r}_i\}, \{\mathbf{R}_I\}, t)$$

# Separation of Length Scales

- Due to the much larger nuclei masses ( $M_I$ ) compared to the electron mass ( $m$ ), the quantum-mechanical nature of nuclei is negligible except in extreme cases like nuclear fusion
- More specifically, the length scale below which a particle's quantum-mechanical nature becomes appreciable at a given temperature  $T$  (*i.e.*, thermal de Broglie wave-length) is much smaller for nuclei than for electron

$$\Lambda_I = \frac{\hbar}{\sqrt{2\pi M_I k_B T}} \ll \overset{\substack{\text{length scale} \\ \text{of interest in QMD}}}{\tilde{\lambda}} \sim \Lambda_{\text{electron}} = \frac{\hbar}{\sqrt{2\pi m k_B T}}$$

Element	$\Lambda$ (a.u.) at 300 K
electron	12.94
proton	0.302
C	$8.72 \times 10^{-2}$
O	$7.55 \times 10^{-2}$
Zn	$3.74 \times 10^{-2}$

1 a.u. (bohr) = 0.529 Å

- Motivate classical & quantum-mechanical descriptions of nuclei & electrons, respectively

# Ehrenfest Molecular Dynamics (EMD)

- Small  $\hbar$  expansion, applied to the nucleus degrees-of-freedom, leads to mixed quantum (for electrons) & classical (for nuclei) dynamical equations

Classical Newton's equation of motion for nucleus positions

$$M_I \frac{d^2}{dt^2} \mathbf{R}_I = - \left\langle \Psi(t) \left| \frac{\partial h(\{\mathbf{r}_i\}, \{\mathbf{R}_I\})}{\partial \mathbf{R}_I} \right| \Psi(t) \right\rangle$$
$$i\hbar \frac{\partial}{\partial t} |\Psi(t)\rangle = h(\{\mathbf{r}_i\}, \{\mathbf{R}_I\}) |\Psi(t)\rangle$$

Time-dependent Schrödinger equation for the electronic wave function  $\Psi$

- See notes on:  
(1) [QMD summary](#) & (2) [QMD equation](#)

# Derivation of EMD Equations (1)

- Dynamics of the electron-nucleus system is encoded in the scattering matrix (or S matrix) in the closed-time path integral form

Unitary time propagator

$$S = \frac{1}{\sum_k \rho_k(\mathbf{R})} \sum_k \rho_k(\mathbf{R}) \langle k\mathbf{R} | U_-(t_0, t_f) U_+(t_f, t_0) | k\mathbf{R} \rangle$$

Initial probability of  
( $k, \mathbf{R}$ ) state at time  $t_0$

$k$ -th electronic state  
with nucleus positions  $\mathbf{R}$

remote future

remote past

$$U_{\pm}(t, t') = T_{\pm} \exp \left( -\frac{i}{\hbar} \int_{t'}^t d\tau H_{\pm}(\tau) \right)$$

Time-ordering operator

- See notes on:

(1) [unitary time propagation](#); (2) [closed-time path integral](#); (3) [QMD equation](#)

# Derivation of EMD Equations (2)

- Path-integral w.r.t. nucleus trajectories:  $H(t) = \frac{\mathbf{p}^2}{2M} + h(\mathbf{r}, \mathbf{R}, t)$

$$S = \int_{\text{path}, p}^{\mathbf{R}(t_0)=\mathbf{R}} D[\mathbf{R}(t)] \exp\left(\frac{i}{\hbar} S_0[\mathbf{R}(t)]\right) T[\mathbf{R}(t)]$$

Sum up all possible  
nuclei trajectories

$$S_0[\mathbf{R}(t)] = \int_p dt \frac{M}{2} \left(\frac{d\mathbf{R}}{dt}\right)^2$$

$$T[\mathbf{R}(t)] = \frac{1}{\sum_k \rho_k(\mathbf{R})} \sum_k \rho_k(\mathbf{R}) \langle k\mathbf{R} | T_p \exp\left[-\frac{i}{\hbar} \int_p dt h(\mathbf{r}, \mathbf{R}(t), t)\right] | k\mathbf{R} \rangle$$

- See note on:  
[QMD equation](#)

# Derivation of EMD Equations (3)

- Keep the leading term of the  $\hbar$  expansion (*i.e.* saddle-point approximation) of the path integral

$$\delta \left\{ S_0[\mathbf{R}(t)] + \frac{\hbar}{i} \ln T[\mathbf{R}(t)] \right\} = 0$$

which amounts to

$$M \frac{d^2}{dt^2} \mathbf{R}_I = - \frac{1}{\sum_k \rho_k(\mathbf{R})} \sum_k \rho_k(\mathbf{R}) \left\langle k(t) \mathbf{R} \left| \frac{\partial h(\mathbf{r}, \mathbf{R}(t), t)}{\partial \mathbf{R}(t)} \right| k(t) \mathbf{R} \right\rangle$$
$$i\hbar \frac{\partial}{\partial t} |k(t), \mathbf{R}\rangle = h(\mathbf{r}, \mathbf{R}(t), t) |k(t), \mathbf{R}\rangle$$

# Born-Oppenheimer Molecular Dynamics

---

- Due to the much larger nuclei masses ( $M_I$ ) compared to the electron mass ( $m$ ), the quantum-mechanical wave function of the system is *separable* to those of the electrons & nuclei
- At ambient conditions, the electronic wave function remains in its ground state ( $|\Psi_0\rangle$ ) with the energy eigenvalue  $\epsilon_0$ , corresponding to the instantaneous nuclei positions ( $\{\mathbf{R}_I\}$ ), with the latter following classical mechanics

$$M_I \frac{d^2}{dt^2} \mathbf{R}_I = - \frac{\partial}{\partial \mathbf{R}_I} \langle \Psi_0 | h(\{\mathbf{r}_i\}, \{\mathbf{R}_I\}) | \Psi_0 \rangle$$
$$h(\{\mathbf{r}_i\}, \{\mathbf{R}_I\}) | \Psi_0 \rangle = \epsilon_0 | \Psi_0 \rangle$$

- See notes on:  
(1) [QMD summary](#) & (2) [adiabatic approximation](#)

# Born-Oppenheimer (BO) MD Derivation (1)

- Expand the wave function in terms of the complete set of eigenstates,  $\{\psi_k(\mathbf{r}, \mathbf{R})\}$ , with fixed nuclei position  $\mathbf{R}$  (*i.e.*, adiabatic basis)

$$\psi(\mathbf{r}, \mathbf{R}, t) = \sum_k \chi_k(\mathbf{R}, t) \psi_k(\mathbf{r}, \mathbf{R})$$
$$h(\mathbf{r}, \mathbf{R}) \psi_k(\mathbf{r}, \mathbf{R}) = E_k(\mathbf{R}) \psi_k(\mathbf{r}, \mathbf{R})$$

- Resulting time-dependent Schrödinger equation

$$\left[ i\hbar \frac{\partial}{\partial t} + \sum_I \frac{\hbar^2}{2M_I} \frac{\partial^2}{\partial \mathbf{R}_I^2} - E_k(\mathbf{R}) - T_{kk}(\mathbf{R}) \right] \chi_k(\mathbf{R}, t) = \sum_{k' \neq k} T_{kk'}(\mathbf{R}) \chi_{k'}(\mathbf{R}, t)$$
$$T_{kk'}(\mathbf{R}) = \sum_I \left\langle k \left| \frac{\hbar}{i} \frac{\partial}{\partial \mathbf{R}_I} \right| k' \right\rangle \cdot \frac{\hbar}{iM_I} \frac{\partial}{\partial \mathbf{R}_I} - \sum_I \left\langle k \left| \frac{\hbar^2}{2M_I} \frac{\partial^2}{\partial \mathbf{R}_I^2} \right| k' \right\rangle$$

Nonadiabatic coupling due to nuclei motion (*cf.* nonadiabatic QMD *via* surface hopping)

Linker *et al.*, *Science Adv.* **8**, eabk2625 (2022); Razakh *et al.*, *PDSEC* (IEEE, '24)

# Born-Oppenheimer (BO) MD Derivation (2)

- Born-Oppenheimer approximation neglects all  $T_{kk'}$  terms; when in the electronic ground state ( $k = 0$ ), off-diagonal transition is negligible if

$$|T_{k0}(\mathbf{R})| \ll E_k(\mathbf{R}) - E_0(\mathbf{R})$$

diagonal term  $T_{kk}$  was shown to be  $O(m/M_I)$

- Classical limit of the resulting equation for nuclei can be derived using the same  $\hbar$  expansion as in the derivation of Ehrenfest MD

$$\left[ i\hbar \frac{\partial}{\partial t} + \sum_I \frac{\hbar^2}{2M_I} \frac{\partial^2}{\partial \mathbf{R}_I^2} - E_k(\mathbf{R}) \right] \chi_k(\mathbf{R}, t) = 0$$

$$M_I \frac{d^2}{dt^2} \mathbf{R}_I = - \frac{\partial}{\partial \mathbf{R}_I} E_k(\mathbf{R}) = - \left\langle k \left| \frac{\partial h(\mathbf{r}, \mathbf{R}, t)}{\partial \mathbf{R}} \right| k \right\rangle$$

- See notes on: **Hellmann-Feynman theorem**

(1) [QMD summary](#) & (2) [adiabatic approximation](#)

# Hellmann-Feynman Theorem

- Consider a Hamiltonian that include a parameter  $\lambda$  (in our case, nuclei positions  $\mathbf{R}$ )

$$\begin{aligned}\frac{dE_\lambda}{d\lambda} &= \frac{d}{d\lambda} \langle \psi_\lambda | \hat{H}_\lambda | \psi_\lambda \rangle \\&= \left\langle \frac{d\psi_\lambda}{d\lambda} \middle| \hat{H}_\lambda \middle| \psi_\lambda \right\rangle + \left\langle \psi_\lambda \middle| \hat{H}_\lambda \middle| \frac{d\psi_\lambda}{d\lambda} \right\rangle + \left\langle \psi_\lambda \middle| \frac{d\hat{H}_\lambda}{d\lambda} \middle| \psi_\lambda \right\rangle \\&= E_\lambda \left\langle \frac{d\psi_\lambda}{d\lambda} \middle| \psi_\lambda \right\rangle + E_\lambda \left\langle \psi_\lambda \middle| \frac{d\psi_\lambda}{d\lambda} \right\rangle + \left\langle \psi_\lambda \middle| \frac{d\hat{H}_\lambda}{d\lambda} \middle| \psi_\lambda \right\rangle \\&= E_\lambda \frac{d}{d\lambda} \langle \psi_\lambda | \psi_\lambda \rangle + \left\langle \psi_\lambda \middle| \frac{d\hat{H}_\lambda}{d\lambda} \middle| \psi_\lambda \right\rangle \\&= \left\langle \psi_\lambda \middle| \frac{d\hat{H}_\lambda}{d\lambda} \middle| \psi_\lambda \right\rangle. \quad \langle \psi_\lambda | \psi_\lambda \rangle = 1\end{aligned}$$

# BOMD Application: H<sub>2</sub> Production from Water

21,140 time steps (129,208 self-consistent-field iterations); unit time-step = 0.242 fs

# Berry Phase

- The adiabatic basis (electronic eigenstates with fixed nucleus positions  $\mathbf{R}(t)$  at each instance of time  $t$ ) with energy  $E_k(\mathbf{R})$ , used here, plays a role in the discussion of Berry (or geometric) phase of electronic wave function during adiabatic turning-on/off of external potential

$$|k(t)\rangle = \exp(i\gamma_k(t)) \exp\left[-\frac{i}{\hbar} \int_0^t dt' E_k(\mathbf{R}(t'))\right] |k(t=0)\rangle$$

$$\gamma_k = \int_{\text{path}} d\mathbf{R} \cdot i \left\langle k(\mathbf{R}) \left| \frac{\partial}{\partial \mathbf{R}} \right| k(\mathbf{R}) \right\rangle$$

Berry phase

- Integration of the Berry phase along a closed path can be nonzero, which is observable (e.g., Aharonov-Bohm effect)
- QXMD uses it to compute electronic polarizability

D. Xiao *et al.*, “Berry phase effects on electronic properties,” *Rev. Mod. Phys.* **82**, 1959 ('10)

D. Vanderbilt, *Berry Phases in Electronic Structure Theory* (Cambridge Univ. Press, '18)

# Quantum-Mechanical Calculation of Polarization

- While polarization  $\mathbf{P} = \int d\mathbf{r} \mathbf{r} |\psi(\mathbf{r})|^2$  is ill-defined under periodic boundary condition, its change  $\Delta \mathbf{P} = \int_0^t dt' \mathbf{j}$  is well-defined, with a proper gauge to compute current  $\mathbf{j}$  (note on [quantum dynamical computation of electronic conductivity](#))
- Change of polarization upon adiabatic switching of finite electric field  $\mathcal{E}$  with periodic boundary condition

R. Resta, *Phys. Rev. Lett.* **80**, 1800 ('98); P. Umari & A. Pasquarello, *ibid.* **89**, 157602 ('02)

$$\Delta P_{\text{el},x} = -\frac{L}{\pi} \text{Im}(\ln \det[\langle \psi_m | \exp(i2\pi x/L) | \psi_n \rangle]) \quad (m, n \in \{\text{occupied}\})$$
$$\{\psi_m\} = \text{argmin}(E_{\text{Kohn-Sham}}[\{\psi_m\}] - \mathcal{E} \Delta P_{\text{el},x}[\{\psi_m\}])$$

- The above formula is equivalent to a sum of valence-band Berry phases

R. D. King-Smith & D. Vanderbilt, *Phys. Rev. B* **47**, 1651('93); I. Souza, J. Iniguez & D. Vanderbilt, *Phys. Rev. Lett.* **89**, 117602 ('02)

$$\Delta \mathbf{P}_{\text{el}} = \int_0^{\mathcal{E}} d\lambda \frac{\partial \mathbf{P}_{\text{el}}}{\partial \lambda} = -\frac{ie}{(2\pi)^3} \sum_{n \in \{\text{occupied}\}} \int_{\text{Brillouin zone}} d\mathbf{k} \left\langle \psi_{n\mathbf{k}} \left| \frac{\partial}{\partial \mathbf{k}} \right| \psi_{n\mathbf{k}} \right\rangle$$

- Above a critical field  $\mathcal{E}_c \sim (\text{energy gap})/(\text{simulation cell size})$ , the energy functional has no minimum, indicating Zener breakdown (*i.e.*, tunneling from valence to conduction bands)

### ABSTRACT

Optoelectronic properties of devices made of two-dimensional materials depend largely on the dielectric constant and thickness of a substrate. To systematically investigate the thickness dependence of dielectric constant from first principles, we have implemented a double-cell method based on a theoretical framework by Martyna and Tuckerman [J. Chem. Phys. **110**, 2810 (1999)] and therewith developed a general and robust procedure to calculate dielectric constants of slab systems from electric displacement and electric field, which is free from material-specific adjustable parameters. We have applied the procedure to a prototypical substrate,  $\text{Al}_2\text{O}_3$ , thereby computing high-frequency and static dielectric constants of a finite slab as a function of the number of crystalline unit-cell layers. We find that two and four layers are sufficient for the high-frequency and static dielectric constants of (0001)  $\text{Al}_2\text{O}_3$  slabs to recover 90% of the respective bulk values computed by a Berry-phase method. This method allows one to estimate the thickness dependence of dielectric constants for various materials used in emerging two-dimensional nanophotonics, while providing an analytic formula that can be incorporated into photonics simulations.
