Normalization

For Argon atoms:
> $m = 6.6 \times 10^{-23}$ gram
> $\varepsilon = 1.66 \times 10^{-14}$ erg (erg = gram•cm^2/second^2)
> $\sigma = 3.4 \times 10^{-8}$ cm

Define length, energy & time units as

$$\begin{cases} \vec{r}_i = \vec{r}_i'\sigma = 3.4 \times 10^{-8}[cm] \times \vec{r}_i' \\ V = V'\varepsilon = 1.66 \times 10^{-14}[erg] \times V' \\ t = \sigma\sqrt{m/\varepsilon}\,t' = 2.2 \times 10^{-12}[sec] \times t' \end{cases}$$
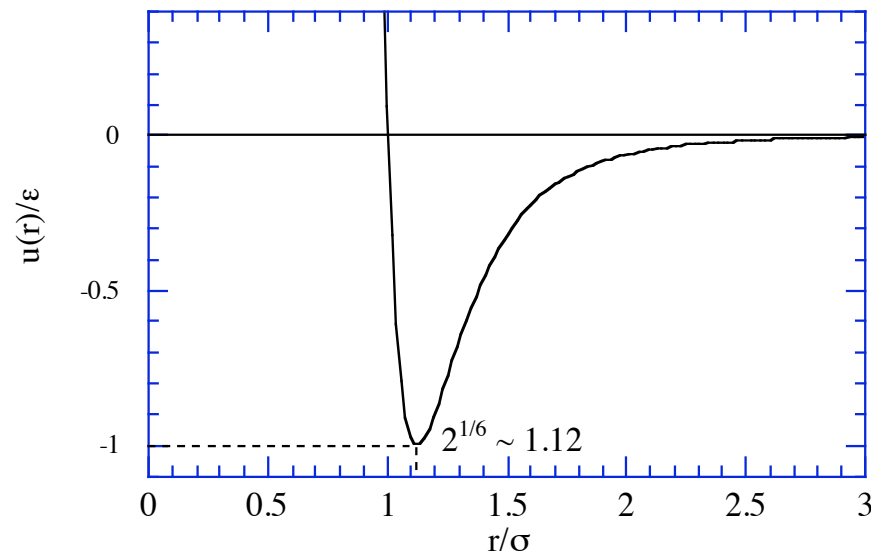

The equation of motion in these units:

$$\frac{d^2\vec{r}_i}{dt^2} = -\frac{\partial V}{\partial \vec{r}_i} = \vec{a}_i$$

$$V(\vec{r}^N) = \sum_{i<j} u(r_{ij})$$

$$u(r) = 4\left(\frac{1}{r^{12}} - \frac{1}{r^6}\right)$$

$$u(r) = 4\left(\frac{1}{r^{12}} - \frac{1}{r^6}\right)$$

Father of Molecular Dynamics

Correlations in the Motion of Atoms in Liquid Argon*

A. RAHMAN

Argonne National Laboratory, Argonne, Illinois

(Received 6 May 1964)

A system of 864 particles interacting with a Lennard-Jones potential and obeying classical equations of motion has been studied on a digital computer (CDC 3600) to simulate molecular dynamics in liquid argon at 94.4°K and a density of 1.374 g cm^{-3}.

Aneesur Rahman—Father of molecular dynamics

Argonne physicist Aneesur Rahman, known worldwide as the "father of molecular dynamics," pioneered the application of computer science to physical systems.

In 1960, Rahman successfully modeled the behavior of a cluster of 864 argon atoms on a computer that could perform only 150,000 calculations per second.

While Argonne's new IBM Blue Gene ® /P supercomputer runs nearly 3 million times faster than Rahman's CDC 3600, today's scientists still base the code for their models on Rahman's algorithms.

Since 1993, the American Physical Society has annually awarded the Aneesur Rahman Prize for outstanding achievement in computational physics research.

Molecular Dynamics Equations

Given initial atomic positions & velocities, $\left\{ \left(\vec{r}_i(0), \vec{v}_i(0) \right) \middle| i = 0, \ldots, N-1 \right\}$,

obtain those at later times, $\left\{ \left(\vec{r}_i(t), \vec{v}_i(t) \right) \middle| i = 0, \ldots, N-1; t \geq 0 \right\}$,

by integrating the ordinary differential equation,

$$\ddot{\vec{r}}_k(t) = \vec{a}_k(t) = -\frac{\partial}{\partial \vec{r}_k} \sum_{i<j} u(r_{ij}) = \sum_{i<j} \vec{r}_{ij}(t) \left(-\frac{1}{r} \frac{du}{dr} \right)_{r=r_{ij}(t)} \left(\delta_{ik} - \delta_{jk} \right)$$

$$\vec{r}_{ij} = \vec{r}_i - \vec{r}_j$$

$$\delta_{ij} = \begin{cases} 1 & i = j \\ 0 & i \neq j \end{cases}$$

where

$$-\frac{1}{r}\frac{du}{dr} = \frac{48}{r^2}\left(\frac{1}{r^{12}} - \frac{1}{2r^6} \right)$$

        compute $\vec{\alpha} = \vec{r}_{ij} \left(-\frac{1}{r}\frac{du}{dr} \right)_{r=|\vec{r}_{ij}|}$

Velocity Verlet Algorithm

Theorem: The following algebraic equation gives the same sequence of states, $\left(\vec{r}_i(n\Delta), \vec{v}_i(n\Delta)\right)$, as that obtained by the Verlet discretization (see lecture note for a proof and the velocity error).

$$
\begin{cases}

Prove phase-space volume conservation: $\dfrac{\partial(x',p')}{\partial(x,p)} = 1$

What phase-space volume conservation means? It's ensemble!

Compare an algorithm variant, Euler:

$$\begin{cases} x' \leftarrow x + p\Delta + \dfrac{1}{2}a(x)\Delta^2 \\[2mm] p' \leftarrow p + a(x)\Delta \end{cases} \rightarrow \dfrac{\partial(x',p')}{\partial(x,p)} \neq 1$$

Error in Energy Conservation

Effect of time-discretization unit, `DeltaT`

$$StepLimit \times (\Delta t)^3 = \frac{t}{\Delta t}(\Delta t)^3 = t(\Delta t)^2$$

Numerical Error in Energy Conservation

- **Trajectory error due to time discretization (p. 7 in the lecture note)**

cf. **Trotter expansion**
Tuckerman *et al.*,

- **For $t = n\Delta$**

$$\begin{cases} \Delta\vec{r}_i = O\left(n\Delta^4 = \dfrac{t}{\Delta}\Delta^4 = t\Delta^3\right) = O(\Delta^3) \\ \Delta\vec{v}_i = O\left(n\Delta^3 = \dfrac{t}{\Delta}\Delta^3 = t\Delta^2\right) = O(\Delta^2) \end{cases}$$
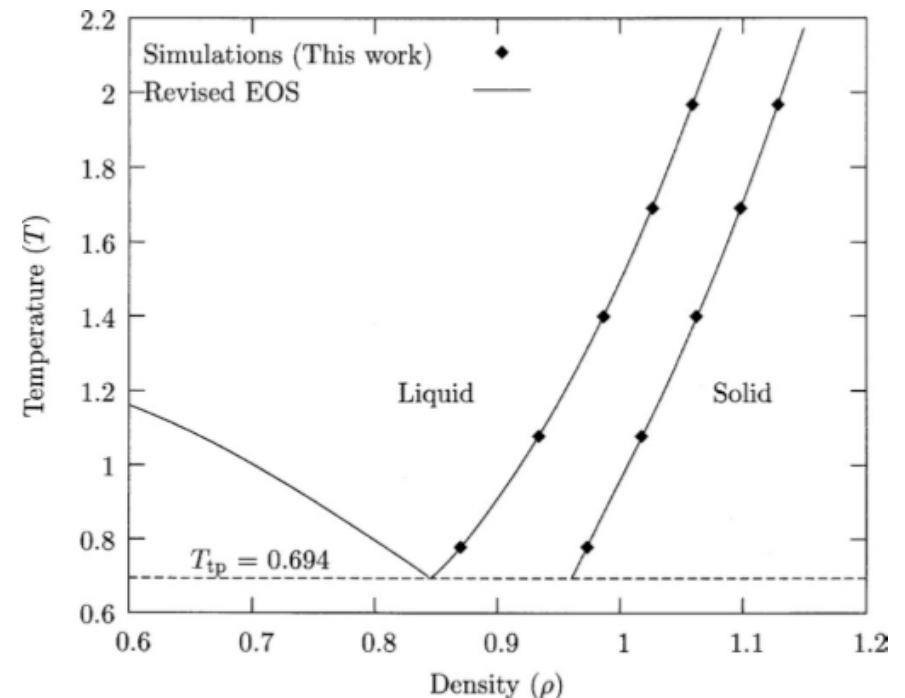

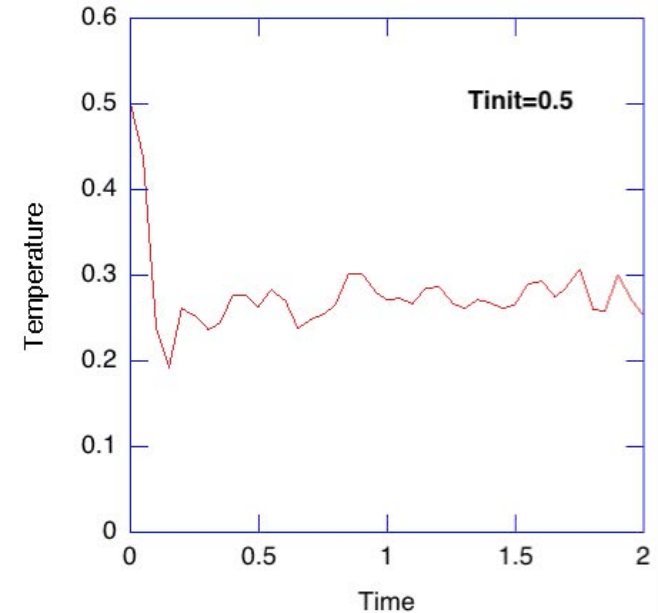

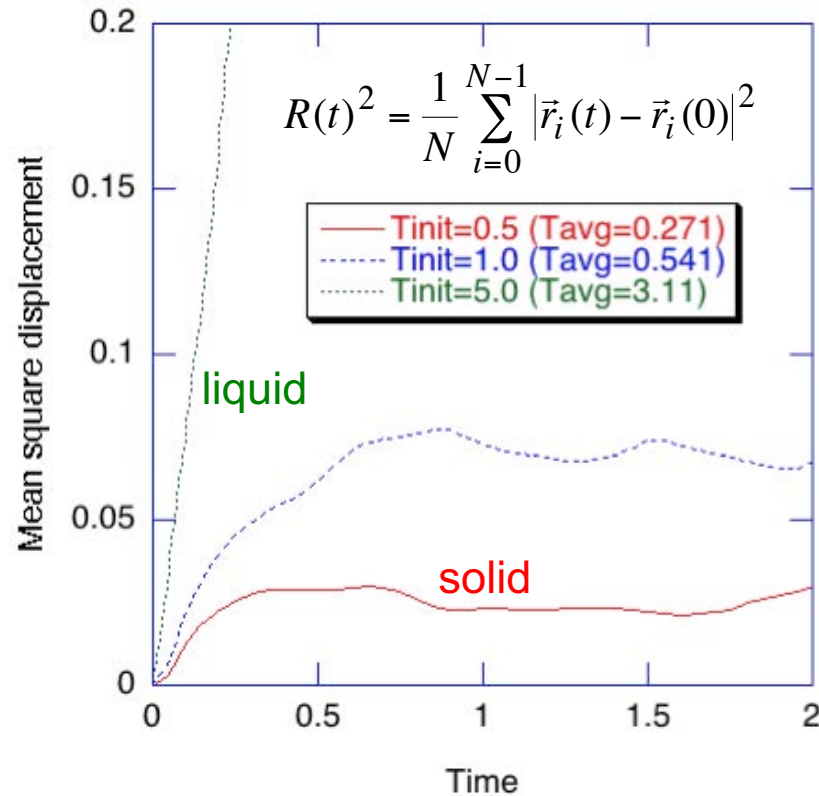

- **Energy error (see the note on error propagation)**

$$\left\langle (\Delta E)^2 \right\rangle = \left|\frac{\partial E}{\partial p}\right|^2 \underbrace{\left\langle (\Delta p)^2 \right\rangle}_{(O(\Delta^2))^2} + \left|\frac{\partial E}{\partial x}\right|^2 \underbrace{\left\langle (\Delta x)^2 \right\rangle}_{(O(\Delta^3))^2}$$
